Leon Bobrowski
Data Exploration and Linear Separability
Lambert Academic Publishing, 2019

Table of Contents

1. Multivariate Learning Sets and their Characteristics 3
2. Probabilistic Models of Classification 12
2.1. Classification based on Bayesian decision theory 12
2.2. Probabilistic models of linear classifiers 14
2.3. Deterministic classification rules 19
3. Designing Linear Classifiers on the Basis of Learning Sets 21
3.1. Fisher's Criterion 21
3.2. Support Vector Machines (*SVM*) 25
3.3. Perceptron criterion function 27
3.4. Evaluation of linear classifiers based on error rate 32
4. Separable Aggregation of Learning Sets by Binary Classifiers 36
4.1. Examples of binary classifiers 36
4.2. Dipolar strategy of separable layer design 41
4.3. Ranked strategy of linearly separable layer design 46
4.4. Hierarchical Structures of separable layers of binary classifiers 52
4.5. Almost separable layers 57
5. Learning Algorithms of Single Formal Neurons 62
5.1. The error correction algorithm 62
5.2. Convergence of the learning algorithm in a finite number of steps 63
5.3. Modifications of the error correction algorithm 65
5.4. Penalty and criterion functions related to the error correction algorithm 67
6. Learning Layers of Formal Neurons 73
6.1. Probabilistic model of a learning sequence 73
6.2. Decomposition of teacher's decisions 74
6.3. Learning processes in hierarchical neuronal networks 77
7. Basis Exchange Algorithms 80
8. The Relaxed Linear Separablity (*RLS*) Method of Feature Subset Selection 94
8.1. Modified perceptron criterion function 94
8.2. Vertices v_k 96
8.3. Feature reduction rule 97
8.4. Feature subset selection in accordance with the *RLS* method 99
8.5. Evaluation of feature subspaces 101
8.6. Examples 102
9. Interval Prognostic Models 106

9.1. Regression learning sets 106
9.2. Interval regressions 107
9.3. Censored survival times 108
9.4. Linear separability of survival learning sets 110
9.5. Optimization of survival models 111
9.6. Feature selection for interval prognostic models 112
9.7. Evaluation of reduced feature subspaces 115
10. Ranked Prognostic Models 120
10.1. Ranked learning sets 120
10.2. Positively and negatively oriented dipoles 121
10.3. Linear separation of differential sets 122
10.4 Penalty and criterion functions defined on differential sets 123
10.5 Differential hyperplanes and vertices in the parameter space 125
10.6. Regularization of the ranked criterion function 126
10.7. Ranked relations between patients based on survival time 128
10.8. Task sheduling on the basis of the pairwise ranks 130
10.9. A ranked prognostic model resulting from causal sequence of liver diseases 133
11. Collinear Patterns 138
11.1. Standard hyperplanes and vertices in the parameter space 138
11.2. Vertexical planes in the feature space 139
11.3. Penalty and criterion functions linked to collinear patterns 141
11.4. Flat patterns 143
11.5. Searching for the main flat patterns 144
11.6. Regularized criterion function $\Psi_{m\lambda}(w)$ 147
11.7. Representation of flat patterns by the oriented graphs G_m 147
12. Diagnostic Maps 151
12.1. Nearest neighbour classification rules 151
12.2. Linear transformations of learning sets 152
12.3. Designing diagnostic maps of the *Hepar* system 153
12.4. Example – diagnostic maps of liver diseases 156
Bibliography 159
